CCR DEADLINE TO MSDH & CUSTOMERS: BY JULY 1, 2021

# 2020 Annual Drinking Water Quality Repo2021 JUN 21 AM 7: 52 Three Forks Water Association PWS ID#: 0700014 June 2021

We're pleased to present to you this year's Annual Quality Water Report. This report is designed to inform you about the quality water and services we deliver to you every day. Our constant goal is to provide you with a safe and dependable supply of drinking water. We want you to understand the efforts we make to continually improve the water treatment process and protect our water resources. We are committed to ensuring the quality of your water. Our water source is from wells drawing from the Coffee Sand Aquifer.

The source water assessment has been completed for our public water system to determine the overall susceptibility of its drinking water supply to identified potential sources of contamination. A report containing detailed information on how the susceptibility determinations were made has been furnished to our public water system and is available for viewing upon request. The wells for the Three Forks Water Association have received lower susceptibility rankings to contamination.

If you have any questions about this report or concerning your water utility, please contact Brian Wilbanks at 662.223.9195. We want our valued customers to be informed about their water utility. If you want to learn more, please attend any of our regularly scheduled meetings. They are held on the first Thursday of each monthly at 7:00 PM at the water office.

We routinely monitor for contaminants in your drinking water according to Federal and State laws. This table below lists all of the drinking water contaminants that we detected during the period of January 1<sup>st</sup> to December 31<sup>st</sup>, 2020. In cases where monitoring wasn't required in 2020, the table reflects the most recent results. As water travels over the surface of land or underground, it dissolves naturally occurring minerals and, in some cases, radioactive materials and can pick up substances or contaminants from the presence of animals or from human activity; microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife; inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban storm-water runoff, industrial, or domestic wastewater discharges, oil and gas production, mining, or farming; pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm-water runoff, and residential uses; organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations and septic systems; radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities. In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. All drinking water, including bottled drinking water, may be reasonably expected to contain at least small amounts of some contaminants. It's important to remember that the presence of these contaminants does not necessarily indicate that the water poses a health risk.

In this table you will find many terms and abbreviations you might not be familiar with. To help you better understand these terms we've provided the following definitions:

Action Level - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Maximum Contaminant Level (MCL) - The "Maximum Allowed" (MCL) is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG) - The "Goal" (MCLG) is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level (MRDL) – The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary to control microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG) — The level of a drinking water disinfectant below which there is no known or expected risk of health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Parts per million (ppm) or Milligrams per liter (mg/l) - one part per million corresponds to one minute in two years or a single penny in \$10,000.

Parts per billion (ppb) or Micrograms per liter - one part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.

| TEST RESULTS |                  |                   |                   |   |                          |      |     |  |  |  |  |

<sup>\*</sup> Most recent sample. No sample required for 2020.

We are required to monitor your drinking water for specific constituents on a monthly basis. Results of regular monitoring are an indicator of whether or not our drinking water meets health standards. During January 1, 2020 – December 31, 2020 we didn't complete monitor or test for Nitrates at the required locations and therefore cannot be sure of the quality of our drinking water during that time.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Our water system is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead. The Mississippi State Department of Health Public Health Laboratory offers lead testing. Please contact 601.576.7582 if you wish to have your water tested.

All sources of drinking water are subject to potential contamination by substances that are naturally occurring or man made. These substances can be microbes, inorganic or organic chemicals and radioactive substances. All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at 1.800.426.4791.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are available from the Safe Drinking Water Hotline 1.800.426.4791.

The Three Forks Water Association works around the clock to provide top quality water to every tap. We ask that all our customers help us protect our water sources, which are the heart of our community, our way of life and our children's future.

2020 Annual Drinking Water Quality Report Three Forks Water Assoc PWS ID= 0700014 June 2021

We're pleased to present by you this year's Armial Clustly Water Report. This report is designed to inform you about the quality water and services and determined you every day. Our constant goal is to practice you with a sale and dependible supply of glinking water. We wait you to understand the efforts we make to continually introduce the saler instrument process; and practice our water resources. We are committed to enter any of your water, the water securing the quality of your water. Our water secure in from west disaving from the Coding Saint Asales.

The source water assessment has been comproled for our public water system to determine the overall susceptibility of its dinning water study to identified potential source, of contamination. A report containing detailed information on how the susceptibility determinations were made has been furnished to be public witter system and is also able for viewing upon request. The wells for the Three Forks Water Association have received lower susceptibility makings to contamination.

If you have any questions about this report or concerning year water utility, please contact Brain Webanks at 502 223 9195. We want our valued customers to be informed about their water utility. If you want to learn more please attend any of our regularly scheduled meetings. They are hold on the first Threaty of each incriting at 700 PM by water office.

We realizely mostlor for confirmants in your disting water according to Federal and State laws. This sape below lists of of the discussy selection contaminants that we detected during the period of January. If his December 3.5° (202), In cases where montaining season occurrences and the reflects from most recent results. As water stress over the subsects of start or undergovered in discovers naturally occurring memors and is some scales, advanture, advantured as a per culture of party is provided to undergovered in discovers naturally occurring memors and is some scales, advanture, advantured as a per culture of the start party specific party, supply systems appointment is without processing or discovers over a superior occurrance, such or such as demands where can be related by occurring or extraor supply indicated is valid. In discovers of sources work as appositive under such science water moths of read-entities can optimize an extraor of seasons work as appositive under supply and the supplier of the process of seasons work as appositive under supply as the supplier of the process of seasons where the supplier of the process of seasons and seasons are contaminated or contaminate of seasons and seasons are contaminated or contaminated as some contaminates. It is important to intermed that the greateness of these contaminates these for necessarily indicate tool the source processing and the seasons and seasons are seasons as a season and seasons are seasons and seasons and seasons and seasons are seasons and seasons and seasons are seasons and season water poses a health risk.

In this table you will find many terms and abbreviations you might not be familiar with. To hislp you better understand these terms we've provided the following definitions.

Action Level - the concentration of a communant which, it exceeded, lingging treatment or other requirements which a water system of follow

Mount it: Contaminant Level (MCL) - The "Naturum Allowed" (MCL) is the highest level of a contaminant mall is allowed in direleting water MCLs are set as close to the MCL or as leasable using the best available beatment technology.

Maximum Contaminant Level Goal (MCLG) - The "Goal" (MCLG) is the level of a contaminant in directing water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Duardeclard Lever (MRDL) - The highest level of a distribution allowed in drowing water. There is convicting evidence that addition of a distribution to a distribution to a distribution of a di

Manmum Resolusi Disordectant Level Goal (MRDLG) - The level of a drinking water disordectant below which there is no brown or expected risk of health. MRDLGs do not reflect the benefits of the use of disordectants to control instructual contaminants.

Parts per million (point) or Milligrams per lifer (mp1) - one part per million corresponds to one minute in two years or a single pen'ny in \$10,000

Parts per billion (ppb) or Micrograms per liter | one part per billion corresponds to one minute in 2 000 years, or a single partny in \$10,000,000
